

ATTACHMENT OPTIONS:

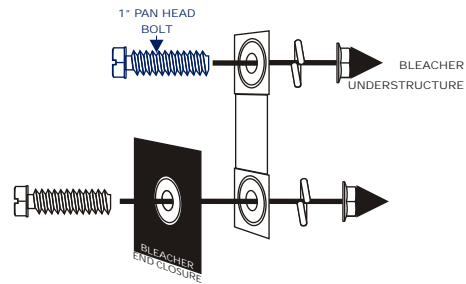

ATTACHMENT A

The tech screw is used when there is not an existing hole in the bleachers understructure.
(A new hole may be drilled if option B is wanted)

ATTACHMENT B

Option B is bolting the strap to the bleacher structure through an existing hole.

- 1 Attach End Closure straps to the bleacher structure using attachment method A or B (See chart above). The straps are attached to the bleacher structure at the furthest point back under each tier/row.

CAUTION: When attaching the straps to the understructure be careful not to interfere with the moving parts of the bleacher.

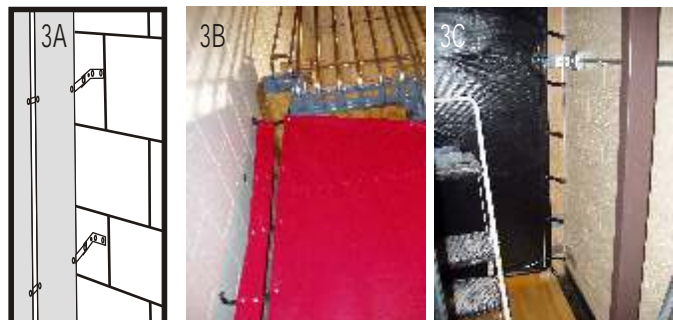

- 2 Attach the End Closure at the front using the longer straps provided. Adjustments may have to be made according to your bleacher system.

Secure the chain at the front and back if there is an attachment point available. This will help keep proper tension and limit how far the bottom of the closure can be raised.

- 3 Attach straps at the back of the End Closure to pull the closure tight. Extra straps may be used to adjust the tension of the closure.
 - A. Attach 3" L-brackets to the wall using masonry screws provided. Secure straps to the L-Bracket.
 - B. Attach straps to the wall directly using masonry screws provided.
 - C. Attach straps to bleacher guard/wall(see picture).

NOTICE

Extra hardware has been provided as some unforeseen circumstances may arise that you may need more than recommended.
